
System Workflow Guide

This guide explains in simple, everyday terms how the IDS Pulse quality management platform works. It serves as a real-time bridge connecting factory floor representatives with office quality teams and accountants.

1. Factory Floor Operations (The Representative)

A. Check-In & Start Shift

The Representative logs in on their phone simulator, selects their assigned assembly plant (e.g., GM Oshawa), and check-ins to officially start tracking logs.

B. Inspected Factory Floor Walks

They perform regular walking sweeps of physical production areas (Online Assembly, Scrap Tables, Sequence Area) to check for defective parts.

C. Logging a Quality Incident

If they discover a part defect, they use the guided camera checklist to capture Wide, Medium, and Close-Up photos. They rub their finger on the screen to draw a red markup arrow directly on the defect, scan the part barcode, and log details.

D. Logging Rework Tasks

If they perform physical repairs on-site (like removing spare bulbs from a housing), they log the reworked quantity and minutes spent inside a Rework Log.

E. Shift Summary Handover

At the end of their shift, they enter their hours worked and mileage, complete a checklist, and submit a final summary, dispatching it to office email queues.

2. Office & Management Portal (Dashboard Users)

A. Instant Real-Time Notifications

As soon as a representative submits data from the floor, the dashboard chimes out a synthesizer audio alert and slides in a toast notification in the corner.

B. Incidents Feed & Defect Heatmaps

Quality teams filter incoming logs by supplier and status level. They view a 3D coordinates blueprint template showing visual hotspots where defects appear.

C. QuickBooks Timesheets & Invoicing

The system automatically tracks hours worked, multiplies mileage by a reimbursement rate of \$0.73/km, and exports formatted CSV sheets for QuickBooks payroll.

D. Standardized Report Exports

Quality managers download branded PDFs or print reports with automated watermarks and dynamic confidentiality taglines.
